### Summary

#### Analog Quantities

Most natural quantities that we see are **analog** and vary continuously. Analog systems can generally handle higher power than digital systems.

Time of Day	Temperature (°C)
1 A.M.	75
2 A.M.	75
3 A.M.	75
4 A.M.	75
5 A.M.	75
6 A.M.	75
7 A.M.	75
8 A.M.	75
9 A.M.	80
10 A.M.	85
11 A.M.	90
12 P.M.	95
1 P.M.	95
2 P.M.	95
3 P.M.	90
4 P.M.	85
5 P.M.	80
6 P.M.	75
7 P.M.	75
8 P.M.	75
9 P.M.	75
10 P.M.	75
11 P.M.	75
12 P.M.	75

Digital systems can process, store, and transmit data more efficiently but can only assign discrete values to each point.

### Summary

#### Analog and Digital Systems

Many systems use a mix of analog and digital electronics to take advantage of each technology. A typical CD player accepts digital data from the CD drive and converts it to an analog signal for amplification.

```
graph LR; CD_drive[CD drive] -- Digital data --> DAC[Digital-to-analog converter]; DAC -- Analog reproduction of music audio signal --> Amp[Linear amplifier]; Amp --> Speaker[Speaker]; Speaker -- Sound waves --> Output[Sound waves];
```

**Summary**

**Binary Digits and Logic Levels**

Digital electronics uses circuits that have two states, which are represented by two different voltage levels called HIGH and LOW. The voltages represent numbers in the binary system.

In binary, a single number is called a *bit* (for *binary digit*). A bit can have the value of either a 0 or a 1, depending on if the voltage is HIGH or LOW.

The diagram shows three voltage levels on a vertical axis:

- HIGH:** A green box representing the range from  $V_{H(min)}$  to  $V_{H(max)}$ .
- Invalid:** A pink box representing the range from  $V_{H(max)}$  to  $V_{L(max)}$ .
- LOW:** A green box representing the range from  $V_{L(max)}$  to  $V_{L(min)}$ .

---

---

**Summary**

**Digital Waveforms**

Digital waveforms change between the LOW and HIGH levels. A positive going pulse is one that goes from a normally LOW logic level to a HIGH level and then back again. Digital waveforms are made up of a series of pulses.

(a) Positive-going pulse: Shows a pulse starting at  $t_0$  (Rising or leading edge) and ending at  $t_1$  (Falling or trailing edge).

(b) Negative-going pulse: Shows a pulse starting at  $t_0$  (Falling or leading edge) and ending at  $t_1$  (Rising or trailing edge).

---

**Summary**

**Pulse Definitions**

Actual pulses are not ideal but are described by the rise time, fall time, amplitude, and other characteristics.

The diagram illustrates various pulse characteristics:

- Amplitude:** The vertical height of the pulse.
- Base line:** The reference level for the pulse.
- Rise time ( $t_r$ ):** The time interval from 10% to 90% of the pulse amplitude.
- Fall time ( $t_f$ ):** The time interval from 90% to 10% of the pulse amplitude.
- Pulse width ( $t_w$ ):** The time interval between the 50% amplitude points.
- Overshoot:** The peak voltage above the nominal high level.
- Ringing:** Oscillations that occur during the transition.
- Droop:** A gradual decrease in the pulse amplitude over time.
- Undershoot:** The dip in voltage below the nominal low level after the fall time.

---

---

---

---

---

---

---

---

---

**Summary**

**Periodic Pulse Waveforms**

Periodic pulse waveforms are composed of pulses that repeats in a fixed interval called the **period**. The **frequency** is the rate it repeats and is measured in hertz.

$$f = \frac{1}{T} \quad T = \frac{1}{f}$$

The **clock** is a basic timing signal that is an example of a periodic wave.

**Example** What is the period of a repetitive wave if  $f = 3.2 \text{ GHz}$ ?

**Solution**  $T = \frac{1}{f} = \frac{1}{3.2 \text{ GHz}} = 313 \text{ ps}$

---

---

---

---

---

---

---

---

---

---

**Summary**

**Pulse Definitions**

In addition to frequency and period, repetitive pulse waveforms are described by the amplitude ( $A$ ), pulse width ( $t_w$ ) and duty cycle. Duty cycle is the ratio of  $t_w$  to  $T$ .

**Summary**

**Basic System Functions**

One type of storage function is the shift register, that moves and stores data each time it is clocked.

Serial bits on input line:  
0101

0	0	0	0
1	0	0	0
0	1	0	0
1	0	1	0
0	1	0	1

Initially the register contains only invalid data or all zeros as shown here.  
First bit (1) is shifted serially into the register.  
Second bit (0) is shifted serially into register and first bit is shifted right.  
Third bit (1) is shifted into register and the first and second bits are shifted right.  
Fourth bit (0) is shifted into register and the first, second, and third bits are shifted right. The register now stores all four bits and is full.

**Summary**

**Programmable Logic**

Programmable logic devices (PLDs) are an alternative to fixed function devices. The logic can be programmed for a specific purpose. In general, they cost less and use less board space than fixed function devices.

A PAL device is a form of PLD that uses a combination of a programmable AND array and a fixed OR array:

The diagram shows a green box labeled 'Programmable AND array' with three input lines on the left and three output lines on the right. These output lines connect to a blue box labeled 'Fixed OR array and output logic', which has three output lines on the right. Dashed lines indicate the internal connections between the two arrays.

**Selected Key Terms**

**Analog** Being continuous or having continuous values.

**Digital** Related to digits or discrete quantities; having a set of discrete values.

**Binary** Having two values or states; describes a number system that has a base of two and utilizes 1 and 0 as its digits.

**Bit** A binary digit, which can be a 1 or a 0.

**Pulse** A sudden change from one level to another, followed after a time, called the pulse width, by a sudden change back to the original level.

---

**Selected Key Terms**

**Clock** A basic timing signal in a digital system; a periodic waveform used to synchronize actions.

**Gate** A logic circuit that performs a basic logic operations such as AND or OR.

**NOT** A basic logic function that performs inversion.

**AND** A basic logic operation in which a true (HIGH) output occurs only when all input conditions are true (HIGH).

**OR** A basic logic operation in which a true (HIGH) output occurs when one or more of the input conditions are true (HIGH).
