## Chapter 1: Introduction to Control Systems Objectives

In this chapter we describe a general process for designing a control system.

A control system consisting of interconnected components is designed to achieve a desired purpose. To understand the purpose of a control system, it is useful to examine examples of control systems through the course of history. These early systems incorporated many of the same ideas of feedback that are in use today.

Modern control engineering practice includes the use of control design strategies for improving manufacturing processes, the efficiency of energy use, advanced automobile control, including rapid transit, among others.

We also discuss the notion of a design gap. The gap exists between the complex physical system under investigation and the model used in the control system synthesis.

The iterative nature of design allows us to handle the design gap effectively while accomplishing necessary tradeoffs in complexity, performance, and cost in order to meet the design specifications.

## Introduction

**System** – An interconnection of elements and devices for a desired purpose.

**Control System** – An interconnection of components forming a system configuration that will provide a desired response.

**Process** – The device, plant, or system under control. The input and output relationship represents the cause-and-effect relationship of the process.

---

---

---

**Introduction**

**Open-Loop Control Systems** utilize a controller or control actuator to obtain the desired response.

Open-loop control system (without feedback).

**Closed-Loop Control Systems** utilizes feedback to compare the actual output to the desired output response.

Closed-loop feedback control system (with feedback).

**Multivariable Control System**

### History

**18th Century** James Watt's centrifugal governor for the speed control of a steam engine.

**1920s** Minorsky worked on automatic controllers for steering ships.

**1930s** Nyquist developed a method for analyzing the stability of controlled systems

**1940s** Frequency response methods made it possible to design linear closed-loop control systems

**1950s** Root-locus method due to Evans was fully developed

**1960s** State space methods, optimal control, adaptive control and

**1980s** Learning controls are begun to investigated and developed.

**Present** and on-going research fields. Recent application of modern control theory includes such non-engineering systems such as biological, biomedical, economic and socio-economic systems

### Examples of Modern Control Systems

The Utah/MIT Dextrous Robotic Hand: A dextrous robotic hand having 18 degrees of freedom, developed as a research tool by the Center for Engineering Design at the University of Utah and the Artificial Intelligence Laboratory at MIT. It is controlled by five Motorola 68000 microprocessors and actuated by 36 high-performance electropneumatic actuators via high-strength polymeric tendons. The hand has three fingers and a thumb. It uses touch sensors and tendons for control. (Photograph by Michael Mitochik. Courtesy of University of Utah.)
